Producer Price Indexes – January 2018

The Producer Price Index for final demand increased 0.4 percent in January. Final demand prices were unchanged in December and moved up 0.4 percent in November. (See table A.) On an unadjusted basis, the final demand index rose 2.7 percent for the 12 months ended in January.

In January, the rise in the index for final demand is attributable to a 0.3-percent increase in prices for final demand services and a 0.7-percent advance in the index for final demand goods.

The index for final demand less foods, energy, and trade services rose 0.4 percent in January, the largest advance since increasing 0.5 percent in April 2017. For the 12 months ended in January, prices for final demand less foods, energy, and trade services moved up 2.5 percent, the largest rise since 12-month percent change data were available in August 2014.

Final Demand

Final demand services: Prices for final demand services advanced 0.3 percent in January following a 0.1-percent decline a month earlier. Nearly two-thirds of the broad-based increase is attributable to the index for final demand services less trade, transportation, and warehousing, which moved up 0.4 percent. Margins for final demand trade services rose 0.3 percent, and prices for final demand transportation and warehousing services advanced 0.4 percent. (Trade indexes measure changes in margins received by wholesalers and retailers.)

Product detail: A major factor in the January increase in prices for final demand services was the index for hospital outpatient care, which rose 1.0 percent. The indexes for apparel, footwear, and accessories retailing; health, beauty, and optical goods retailing; residential real estate services (partial); long-distance motor carrying; and hospital inpatient care also moved higher. In contrast, margins for chemicals and allied products wholesaling declined 2.3 percent. Prices for wireless telecommunication services and airline passenger services also fell. (See table 4.)

Final demand goods: The index for final demand goods jumped 0.7 percent in January, the sixth consecutive increase. Over 80 percent of the January advance can be traced to prices for final demand energy, which climbed 3.4 percent. The index for final demand goods less foods and energy rose 0.2 percent. Conversely, prices for final demand foods fell 0.2 percent.

Product detail: Nearly half of the January increase in the index for final demand goods is attributable to prices for gasoline, which climbed 7.1 percent. The indexes for residential electric

power, iron and steel scrap, diesel fuel, jet fuel, and fresh and dry vegetables also moved higher. In contrast, prices for chicken eggs fell 38.9 percent. The indexes for residential natural gas and for power cranes, draglines, and shovels also declined.

Intermediate Demand by Commodity Type

Within intermediate demand in January, prices for processed goods increased 0.7 percent, the index for unprocessed goods advanced 0.9 percent, and prices for services edged up 0.1 percent. (See tables B and C.)

Processed goods for intermediate demand: The index for processed goods for intermediate demand climbed 0.7 percent in January, the sixth straight rise. Seventy percent of the January advance is attributable to a 2.5-percent increase in prices for processed energy goods. The index for processed materials less foods and energy also moved higher, rising 0.3 percent. Conversely, prices for processed foods and feeds moved down 0.3 percent. For the 12 months ended in January, the index for processed goods for intermediate demand advanced 4.6 percent.

Product detail: A major factor in the January increase in prices for processed goods for intermediate demand was the index for diesel fuel, which rose 5.1 percent. Prices for gasoline, commercial electric power, jet fuel, primary nonferrous metals, and copper and brass mill shapes also moved higher. In contrast, the processed eggs index fell 13.2 percent. Prices for utility natural gas and ethanol also declined. (See table 5.)

Unprocessed goods for intermediate demand: The index for unprocessed goods for intermediate demand increased 0.9 percent in January, the third straight advance. Most of the January rise can be attributed to the index for unprocessed nonfood materials less energy, which climbed 3.8 percent. The index for unprocessed energy materials advanced 0.5 percent. Conversely, prices for unprocessed foodstuffs and feedstuffs declined 0.8 percent. For the 12 months ended in January, the index for unprocessed goods for intermediate demand climbed 2.5 percent.

Product detail: A major factor in the January increase in the index for unprocessed goods for intermediate demand was prices for iron and steel scrap, which jumped 12.9 percent. The indexes for crude petroleum, slaughter barrows and gilts, slaughter chickens, corn, and nonferrous scrap also moved higher. In contrast, prices for slaughter cattle fell 4.9 percent. The indexes for natural gas and wastepaper also moved lower.

Services for intermediate demand: Prices for services for intermediate demand inched up 0.1 percent in January following no change in December. Leading the increase, the index for services less trade, transportation, and warehousing for intermediate demand advanced 0.1 percent. Prices for transportation and warehousing services for intermediate demand rose 0.3 percent. Conversely, margins for trade services for intermediate demand declined 0.3 percent. For the 12 months ended in January, the index for services for intermediate demand climbed 2.9 percent.

Product detail: A 2.7-percent increase in the index for business loans (partial) was a leading factor in the January rise in prices for services for intermediate demand. The indexes for securities brokerage, dealing, investment advice, and related services; network compensation from broadcast and cable television; paper and plastics products wholesaling; and long-distance motor carrying also moved higher. In contrast, margins for chemicals and allied products wholesaling fell 2.3 percent. The indexes for machinery and equipment parts and supplies wholesaling, internet advertising (sold by non-print publishers), and airline passenger services also decreased.

Intermediate Demand by Production Flow

Stage 4 intermediate demand: Prices for stage 4 intermediate demand advanced 0.3 percent in January after no change in December. In January, the index for total goods inputs to stage 4 intermediate demand climbed 0.7 percent, while prices for total services inputs were unchanged. (See table D.) Increases in the indexes for diesel fuel, gasoline, commercial electric power, business loans (partial), legal services, and paper and plastics products wholesaling outweighed declines in the indexes for machinery and equipment parts and supplies wholesaling, chemicals and allied products wholesaling, and prepared poultry. (See table 6.) For the 12 months ended in January, prices for stage 4 intermediate demand moved up 3.1 percent.

Stage 3 intermediate demand: The index for stage 3 intermediate demand rose 0.4 percent in January, the sixth straight advance. In January, prices for total goods inputs to stage 3 intermediate demand increased 0.8 percent. The index for total services inputs was unchanged. Higher prices for gasoline, jet fuel, slaughter barrows and gilts, slaughter chickens, diesel fuel, and business loans (partial) outweighed decreases in the indexes for raw milk, slaughter cattle, and chemicals and allied products wholesaling. For the 12 months ended in January, prices for stage 3 intermediate demand climbed 4.1 percent.

Stage 2 intermediate demand: The index for stage 2 intermediate demand increased 0.5 percent in January, the seventh consecutive rise. In January, prices for total goods inputs to stage 2 intermediate demand moved up 0.5 percent, and the index for total services inputs advanced 0.3 percent. Higher prices for crude petroleum; network compensation from broadcast and cable television; legal services; securities brokerage, dealing, investment advice, and related services; commissions from sales of insurance; and liquefied petroleum gas outweighed declines in the indexes for natural gas, thermoplastic resins and plastics materials, and cable network advertising time sales. For the 12 months ended in January, prices for stage 2 intermediate demand rose 3.0 percent.

Stage 1 intermediate demand: Prices for stage 1 intermediate demand advanced 0.9 percent in January, the eighth straight increase. In January, the index for total goods inputs to stage 1 intermediate demand jumped 1.7 percent. In contrast, prices for total services inputs fell 0.2 percent. Rising prices for iron and steel scrap, diesel fuel, business loans (partial), gasoline, nonferrous scrap, and crude petroleum outweighed declines in the indexes for deposit services (partial), primary basic organic chemicals, and natural gas. For the 12 months ended in January, prices for stage 1 intermediate demand moved up 5.6 percent.

Recalculation of Seasonal Adjustment Factors

Effective with this report, seasonal adjustment factors have been recalculated to reflect price-movement patterns during 2017 for the Final Demand-Intermediate Demand (FD-ID) System and commodity-grouping indexes. This routine annual recalculation may affect previously published seasonally adjusted indexes and percent changes for January 2013 through December 2017.

Revised seasonally adjusted data for this period, as well as seasonal adjustment factors for directly adjusted commodity indexes to be used through December 2018, were released February 13, 2018. To obtain this information,

contact the Division of Industrial Prices and Price Indexes, Section of Index Analysis and Public Information at *ppi-info@bls.gov* or (202) 691-7705, or visit the Producer Price Index homepage at www.bls.gov/ppi.

Tables E and F below provide monthly seasonally adjusted percent changes for major FD-ID system indexes in 2017, based on former and recalculated seasonal factors. These percent changes include final price data through August 2017 and may differ from values shown in tables A through D of this release, which include final price data through September 2017.

PPI Weights Updated

With the release of January 2018 Producer Price Index (PPI) data on February 15, 2018, the Bureau of Labor Statistics updated PPI value weights to more accurately reflect recent production and marketing patterns. The updated weights are based on shipment values from the year 2012. These value weights come from the Census of Manufactures, the Census of Mining, the Census of Services, and the Census of Agriculture. PPI weights were based on 2007 Census shipment values from January 2012 through December 2017.

All PPIs were affected by this weight update, including all the industry net output indexes, as well as indexes for traditional commodity groupings. In addition, weights were updated from the 2007 to the 2012 Census for all Final demand-Intermediate demand (FD-ID) indexes, durability of product indexes, special commodity-grouping indexes, and inputs to industry indexes. This weight revision did not result in changes to the arithmetic reference base for indexes, the dates when PPIs are set to 100.

It is important to note that the basic structures of the PPI commodity and FD-ID classification systems did not change as a result of the weight revision. However, PPIs classified according to the North American Industry Classification System (NAICS) were updated to reflect 2017 NAICS definitions established by the U.S. Census Bureau. The weight update also resulted in shifting relative importance values. These shifts impacted aggregate indexes in a manner commensurate with the relative gains and losses in value weights from 2007 to 2012.

In addition, PPI sample updates normally occurring with the release of October and February data were combined and released in conjunction with this weight update. Commodity and FD-ID relative importance figures for December 2017 were released on February 13, 2018, two business days prior to the release of January 2018 PPI data. This information is available on the PPI website at www.bls.gov/ppi or by contacting the PPI Section of Index Analysis and Public Information at ppi-info@bls.gov or (202)691-7705.

Resampling of Industries

Effective with this report, the Producer Price Index (PPI) includes data for 31 resampled industries classified according to the 2017 North American Industry Classification System (NAICS). The Bureau of Labor Statistics periodically updates the sample of producers providing data for the PPI to reflect current conditions more accurately when the structure, membership, technology, or product mix of an industry shifts.

The first results of this systematic process were published in July 1986. Subsequent efforts have been completed at regular intervals.

For information on index additions, deletions, and recodes effective January 2018, see tables 15 through 20 of this report, or contact the PPI's Section of Index Analysis and Public Information at ppi-info@bls.gov or (202) 691-7705.

PPI Updates the Publication Structure for NAICS 622110, General Medical and Surgical Hospitals

Effective with the release of Producer Price Index (PPI) data for January 2018, the PPI program has modified the publication structure of indexes for General medical and surgical hospitals, North American Industry Classification System (NAICS) code 622110. These indexes were formerly structured based on Major Diagnostic Categories (MDCs). With this update, the index structure for NAICS 622110 will be based on the [International Classification of Diseases \(ICD\)](#).

The ICD structure has several advantages over the MDC system, including the availability of Economic Census

data by ICD code and comparability with other BLS products, such as the [BLS disease-based price indexes](#). The move to the ICD structure also was recommended by the American Hospital Association, a national organization that serves roughly 5,000 hospitals and other health care providers.

Unfortunately, there is limited continuity between the MDC- and ICD-based index data. Table 1 lists the indexes that will continue to publish under the new structure, table 2 lists the MDC-based indexes which were discontinued, and table 3 identifies the newly introduced ICD-based indexes.

PPI Introduces Hedonic Price Estimation for Integrated Microcircuits Indexes

Effective with the release of Producer Price Index (PPI) data for January 2018 on February 15, 2018, the Bureau of Labor Statistics began using hedonic modeling to estimate quality adjusted prices for desktop microprocessor items within the PPI indexes for integrated microcircuits:

- [PCU3344133344131, Semiconductors and related device manufacturing: Integrated microcircuits, including semiconductor networks, microprocessors, and MOS memories](#)
- [WPU11783911, Machinery and equipment: Integrated microcircuits](#)

Desktop microprocessors are subject to rapid technological change. This makes it difficult to perform quality adjustment, which requires distinguishing price changes arising from changes in microprocessor quality from price changes resulting from other factors. The following characteristics are the main

measures of quality for microprocessors. PPI collects information pertaining to these measures from publicly available sources:

- Cores
- Threads
- Base frequency
- Turbo frequency
- Cache¹
- Thermal design power (TDP)
- Integrated graphics

Beginning with this release, PPI is using a two-period time dummy hedonic model to measure quality-adjusted price change for the desktop microprocessor items in the integrated microcircuits indexes. The basic regression formula is shown in Equation 1, and the results for January 2018 are shown in Table 1.

Equation 1

$$\text{Log Price}_{it} = \alpha_0 + \Delta d_{\tau+1} + \beta_2(\text{Log } X_{2i}) + \beta_3(\text{Log } X_{3i}) + \dots + \beta_K(\text{Log } X_{Ki}) + \mu_{it}$$

Where:

- Log Price_{it} is the log price of the i th product in period t
- α_0 is the intercept
- $\text{Log } X_i$ are the logged variables representing product characteristics
- $d_{\tau+1}$ is the indicator for period two
- Δ is the time dummy coefficient
- $\beta_2 \dots \beta_K$ are the regression/slope coefficients
- μ_{it} is the residual or error term

The two periods in the model are adjacent quarters. The time dummy coefficient gives an estimate of price change between the two quarters when the variables representing product characteristics have been controlled for. The product characteristics that may be included in the model are those listed above. The PassMark benchmark is also included in the model.²

The choice of regressors affects the time dummy coefficient estimate. PPI turned to statistical learning to evaluate objectively the performance of different model specifications. Specifically, PPI used repeated cross-validation

to calculate the *mean squared error* (MSE) for different model specifications. The MSE is calculated by using a model to predict the prices of observations and then finding the differences between the predictions and the actual prices. PPI selected the model with the lowest MSE because the lower the MSE, the better predictive performance of the model. Please note that PPI constrained the PassMark variable in the model because performance benchmarks can capture improvements in microprocessors that are not captured by the other characteristics.

*Significant at the 5 percent level. Standard errors are in parentheses.	

Using the procedure described above, in addition to the time dummy and performance benchmark variables, two variables were selected. The model estimates a price change of 0.71 percent for desktop microprocessors.

PPI plans to re-estimate the hedonic desktop microprocessors model quarterly. Each time the model is re-estimated, the specification selection method for variable

selection will be used. This may cause the model specification to change from quarter to quarter. Additional information on the use of hedonic models in the PPI is available at <https://stats.bls.gov/ppi/ppicomqa.htm>.

¹ Cache is divided by the number of cores in the microprocessor.

² Passmark is a company that has developed a suite of software that gauges the performance of microprocessors.

¹ Further information about the Final Demand-Intermediate Demand Aggregation system is available online at <https://www.bls.gov/ppi/fdidaggregation.htm>.

² Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available. Individual items and subtotals may not add exactly to totals because of rounding differences.

³ The indexes for September 2017 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

⁴ PPI defines Total finished as including only the personal consumption and private capital investment portions of final demand.

⁵ Trade indexes measure changes in margins received by wholesalers and retailers.

⁶ The PPI definition of foods does not include food and beverages for immediate consumption. PPI defines food and beverages for immediate consumption as the service of preparing meals, snacks, and beverages to customer order for immediate on-premises and off-premises consumption.

⁷ Distributive services include transportation, warehousing, and trade of goods.

¹ Further information about the Final Demand-Intermediate Demand Aggregation system is available online at <https://www.bls.gov/ppi/ffdagggregation.htm>

² Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available. Individual items and subtotals may not add exactly to totals because of rounding differences.

³ The indexes for September 2017 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

¹ The indexes for September 2017 have been recalculated to incorporate late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

² Trade indexes measure changes in margins received by wholesalers and retailers.

³ PPI data for these Net Inputs to Industry Indexes are organized by Bureau of Economic Analysis (BEA) Industry code. The set of products included in an industry input index and the weights for each commodity included in the index are derived from the BEA's Input-Output Accounts Use of Commodities by Industry table in conjunction with U.S. Census Bureau revenue data. Brief Explanation of Producer Price Indexes

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measures the average change over time in prices received (price changes) by producers for domestically produced goods, services, and construction. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective.

More than 10,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors. Over time, new PPIs have been introduced for products of industries in the services and construction sectors of the U.S. economy. As of January 2018, the PPI covered 71 percent of services as measured by 2012 Census revenue, and 31 percent of construction.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Final demand-Intermediate demand (FD-ID) indexes, (2) commodity indexes, and (3) indexes for the net output of industries and their products. The FD-ID structure organizes products by class of buyer and degree of fabrication as well as by stage of production. The commodity structure organizes products by similarity of end use or product type. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Final Demand–Intermediate Demand Indexes

The PPI FD-ID structure measures price change for goods, services, and construction sold to final demand and to intermediate demand. The FD-ID system replaced the PPI stage-of-processing (SOP) system as PPI's primary aggregation model with the release of data for January 2014. The FD-ID model expands coverage beyond that of the SOP system through the addition of services, construction, exports, and government purchases.

Compared with finished goods under the SOP system, the PPI for final demand goods includes nearly a 50 percent expansion of coverage. This increase can be traced to the addition of government purchases and exports. For overall final demand, expansion to include final demand services represents an even larger increase in coverage. In December 2017, final demand goods were about 33 percent of overall final demand, final demand services were roughly 65.5 percent, and final demand construction was about 1.5 percent of final demand. Within intermediate demand, coverage of services for intermediate demand resulted in about a 45 percent increase in coverage of the intermediate demand portion of the economy.

FD-ID indexes are constructed from commodity-based producer output price indexes. Commodities are allocated to aggregate indexes primarily based on the type of buyer. The main source of data used to determine the type of buyer is the "Use of commodities by industries, before redefinition," table

from the Benchmark Input-Output Accounts of the U.S. In many cases, the same commodity is purchased by different types of buyers. As a result, commodities are often included in several FD-ID indexes. For example, regular gasoline is purchased for personal consumption, export, government use, and business use. The PPI program publishes only one commodity index for regular gasoline (wpu057104), reflecting sales to all types of buyers, and this index is used in all aggregations regardless of whether the gasoline is sold for personal consumption, as an export, to government, or to businesses. Proportions based on BEA "Use of Commodities" data are used to allocate the correct portion of the total weight of gasoline to each use category. In cases when buyer type is an important price determining characteristic, indexes are created based on specific buyer type. For example, within the PPI category for loan services, separate indexes for consumer loans and business loans were constructed. For more information relating to the FD-ID structure, see "A new, experimental system of indexes from the PPI program" in the February 2011 *Monthly Labor Review*.

Final Demand: The final demand portion of the FD-ID structure measures price change for commodities sold for personal consumption, capital investment, government, and export. The system is composed of six main price indexes: final demand goods; final demand trade services; final demand transportation and warehousing services; final demand services less trade, transportation, and warehousing; final demand construction; and overall final demand.

The final demand goods index measures price change for both unprocessed and processed goods sold to final demand. Fresh fruits sold to consumers and computers sold for capital investment are examples of transactions included in the final demand goods price index. The final demand trade services index measures price change for the retailing and wholesaling of merchandise sold to final demand, generally without transformation. (Trade indexes measure changes in margins received by wholesalers and retailers.) The final demand transportation and warehousing services index tracks price change for transportation of passengers, as well as, transportation of cargo sold to final demand, and also includes prices for warehousing and storage of goods sold to final demand. The final demand services less trade, transportation, and warehousing index measures price change for all services other than trade and transportation sold to final demand. Publishing, banking, lodging, and health care are examples of these services. The final demand construction index tracks price change for new construction, as well as maintenance and repair construction sold to final demand. Construction of office buildings is an example of a commodity that would be included in the final demand construction index. Lastly, the overall final demand index tracks price change for all types of commodities sold to final demand by combining the five final demand component indexes described above.

Intermediate Demand: The intermediate demand portion of the FD-ID system tracks price change for goods, services, and construction products sold to businesses as inputs to

production, excluding capital investment. The system includes two parallel treatments of intermediate demand. The first treatment organizes intermediate demand commodities by type. The second organizes intermediate demand commodities into production stages, with the explicit goal of developing a forward-flow model of production and price change.

The intermediate demand by commodity type portion of the system organizes commodities by similarity of product. The system is composed of six main price indexes: unprocessed goods for intermediate demand; processed goods for intermediate demand; intermediate demand trade services; intermediate demand transportation and warehousing services; intermediate demand services less trade, transportation, and warehousing; and intermediate demand construction.

The unprocessed goods for intermediate demand price index measures price change for goods sold to businesses as inputs to production that have undergone no fabrication. Crude petroleum sold to refineries is an example of an unprocessed good sold to intermediate demand. The processed goods for intermediate demand index tracks price change for fabricated goods sold as business inputs. Examples include car parts sold to car manufacturers and gasoline sold to trucking companies. The index for trade services for intermediate demand measures price change for the services of retailing and wholesaling goods purchased by businesses as inputs to production. The intermediate demand transportation and warehousing services index measures price change for business travel, as well as, transportation and warehousing of cargo sold to intermediate demand. The intermediate demand services less trade, transportation, and warehousing index measures price change for services other than trade, transportation, and warehousing sold as inputs to production. Legal and accounting services purchased by businesses are examples of intermediate demand services excluding trade, transportation, and warehousing. Finally, the construction for intermediate demand index measures price change for construction purchased by firms as inputs to production. The index for construction for intermediate demand tracks price change for maintenance and repair construction purchased by firms.

The production flow treatment of intermediate demand is a stage-based system of price indexes. These indexes can be used to study price transmission across stages of production and final demand. This system is constructed in a manner that maximizes forward flow of production between stages, while minimizing back-flow of production. The production flow treatment contains four main indexes: intermediate demand stage 1, intermediate demand stage 2, intermediate demand stage 3, and intermediate demand stage 4.

Indexes for the four stages were developed by first assigning each industry in the economy to one of four stages of production, where industries assigned to the fourth stage primarily produce output consumed as final demand, industries in the third stage primarily produce output consumed by stage 4 industries, industries assigned to the second stage primarily produce output consumed by stage 3 industries, and industries assigned to the first stage produce output primarily consumed by stage 2 industries. The four indexes then track prices for the net inputs consumed by

industries in each of the four stages of production. The stage 4 intermediate demand index, for example, tracks price change for inputs consumed, but not produced, by industries included in the fourth stage of production. Hence, the index tracks price change in inputs to industries that primarily produce final demand commodities (stage 4 producers primarily produce commodities sold to final demand).

Examples of heavily weighted goods-producing industries in stage 4 include the manufacture of light trucks and utility vehicles, automobiles, and pharmaceuticals. Retail trade, food service and drinking places, and hospitals are examples of heavily weighted service industries included in stage 4. Stage 4 also includes all new construction industries. Examples of goods consumed by stage 4 industries include motor vehicle parts, commercial electric power, plastic construction products, biological products, and beef and veal. Engineering services, machinery and equipment wholesaling, long distance motor carrying, and legal services constitute examples of services consumed by stage 4 industries.

Examples of highly weighted goods-producing industries included in stage 3 are motor vehicle parts manufacturing, animal (except poultry) slaughtering and processing, and semiconductor manufacturing. Services industries classified in stage 3 include wholesale trade; insurance carriers; architecture, engineering, and related services; and hotels and motels. Examples of goods consumed by stage 3 industries include slaughter steers and heifers, industrial electric power, and hot rolled steel bars, plates, and structural shapes. Services commonly consumed by stage 3 industries include commissions from sales of property and casualty insurance, business loans, temporary help services, and administrative and general management consulting services.

Petroleum refineries; electricity generation, transmission, and distribution; natural gas distribution; cattle ranching and farming; and plastic materials and resin manufacturing are among the goods-based industries assigned to stage 2. Services industries that are heavily weighted in stage 2 include management of companies and enterprises; non-depository credit intermediation; insurance agencies and brokerages; and services to buildings and dwellings. Goods commonly purchased by stage 2 industries include crude oil, natural gas, formula feeds, and primary basic organic chemicals. Services that are heavily weighted in the intermediate demand stage 2 index are legal services, business loans, and cellular phone and other wireless telecommunication.

Goods producing industries in stage 1 include oil and gas extraction, paper mills, and grain farming. Real estate, legal services, and advertising services are examples of highly weighted services industries included in stage 1. Examples of goods consumed by stage 1 industries are commercial and industrial electric power and gasoline. Services commonly consumed by stage 1 industries include solid waste collection, chemicals and allied products wholesaling, and guestroom or unit rental. It should be noted that all inputs purchased by stage 1 industries are by definition produced either within stage 1 or by latter stages of processing, leaving stage 1 less useful for price transmission analysis. For additional information on industry stage assignments, see <https://www.bls.gov/ppi/industryflowstage.htm>.

Comparing the PPI with CPI

Although some data users utilize the PPI as a potential indicator of the Consumer Price Index (CPI), there are many reasons why the PPI and the CPI may diverge. The scope of the personal consumption portion of the PPI includes all marketable output sold by domestic producers for households. The scope of the CPI includes goods and services provided by business or government, where explicit user charges are paid by consumers. For example, the most heavily weighted item in the CPI, owners' equivalent rent, is excluded from the PPI. The scope of the CPI includes imports. The PPI excludes imports. The CPI only includes components of personal consumption directly paid for by the consumers, while the PPI includes components of personal consumption that may not be paid for by consumers. For example, the PPI includes medical services paid for by third parties. In contrast to CPI, PPI does not completely cover services. PPIs exclude taxes, since they do not represent producer revenue. Conversely, sales and other taxes paid by consumers are part of household expenditure and are included in the CPI. Additional technical differences between PPI and CPI also exist. For more information see "Comparing new final demand producer price indexes with other Government price indexes," *Monthly Labor Review*, January 2014, at <https://www.bls.gov/opub/mlr/>.

Commodity Indexes

The commodity classification of the PPI organizes goods, services, and construction by similarity of product or end use, disregarding industry of origin. With the release of data for July 2009, PPI expanded its commodity structure to include indexes for services and construction products. Prior to this date, the PPI commodity structure only included products from goods producing sectors. Table 9 of the *PPI Detailed Report* includes data for commodity indexes, organized in a hierarchal structure, including major groupings, subgroups, product classes, sub-product classes, and individual items.

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 11 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes), Census product classes (7- and 8-digit codes), products (9-digit codes), more detailed sub-products (11-digit codes), and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product categories. Every industry has primary product indexes that show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products make up a plurality of its total shipment value. In

addition, most industries have secondary product indexes that show changes in prices received by establishments for products chiefly made in some other industry. Some industries have miscellaneous receipts indexes that track price changes for other sources of revenue received by establishments within the industry that are not derived from sales of their products; for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are constructed using selling prices reported by establishments of all sizes, selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms also are chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. The survey is conducted online via the BLS Internet Data Collection Facility (IDCF).

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of actual prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Information on these resampling efforts are noted in the *PPI News Release* and *PPI Detailed Report* in the months they occur.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service and construction sector industries have been introduced into the PPI. The following list of industries introduced since the mid-1990s includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Weights

Weights for most commodity groupings of the PPI, as well as, weights for commodity-based aggregate indexes calculated from commodity groupings, such as FD-ID indexes, currently reflect 2012 values of shipments as reported in the *Census of Manufactures* and other sources. From January 2012 to December 2017, PPI weights were derived from 2007 shipment values. Industry indexes now are calculated under the 2017 NAICS structure utilizing 2012 value of shipment weights and 2007 net output ratios. The periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity indexes are based on gross shipment values, including values of shipments between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities (which is composed of major commodity groupings 01 through 15), are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. The intermediate demand by commodity type FD-ID indexes partially correct for this defect, but industry indexes, final demand FD-ID indexes, and intermediate demand by production flow FD-ID indexes consistently correct for this at all levels of aggregation. Therefore, industry and FD-ID indexes are more appropriate than broad commodity groupings for analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including most commodity groups and individual items) were placed on a new reference base, 1982 = 100. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982

reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products. The FD-ID indexes typically have a reference base of November 2009 = 100.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, “Producer Prices,” in the *BLS Handbook of Methods*. This chapter can be downloaded from the BLS Web site at <https://www.bls.gov/pub/hom/homch14.htm>.

Calculating Index Changes

Each PPI measures price changes from a reference period that equals 100.0. An increase of 5.5 percent from the reference period in the Final Demand Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: prices received by domestic producers of a sample of final demand goods have risen from \$100 in November 2009 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of final demand goods are 10 percent lower than they were in November 2009.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Index point change

Final Demand Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5

Index percent change

Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data

that are generally cited when escalating long-term contracts such as purchasing agreements or real estate leases. For more information, see *Price Adjustment Guide for Contracting Parties*, on the Web at <https://www.bls.gov/ppi/ppiescalation.htm>.

Seasonal adjustment is accomplished using X-13 ARIMA, a software package published by the U.S. Census Bureau. Each year, the seasonal status of most commodity indexes is reevaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data from the prior 5 years. Updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or an aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than does the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for FD-ID indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (six-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it; if the pattern keeps shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products, but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of almost 400 seasonally adjusted series, only 42 were subject to intervention in 2018.

For more information relating to seasonal adjustment methods, see “Summary of Changes to the PPI’s Seasonal Adjustment Methodology” in the January 1995 issue of *Producer Price Indexes*, and “PPI and CPI Seasonal Adjustment: an Update” in the July 2010 *Monthly Labor Review*.

Producer Price Index Data on the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, use of these sites eclipsed more traditional methods of data

dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 4 million instances of PPI data and tables being downloaded from the BLS website during the 12 months ended December 31, 2017.

Retrieving PPI data from the PPI Web site

PPI data can be obtained from the WWW address (<https://www.bls.gov/ppi>). On this page, under the tab labeled “Featured PPI databases” links provide the following methods of data retrieval:

- **Top Picks** is a form-based application for both Industry Data and Commodity Data that allows the user to quickly obtain PPI time series data by selecting the high-level aggregate and other commonly requested time series, including the All Commodities Index and the FD-ID indexes (for example, Final Demand). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- **One-Screen Data Search and Multi-Screen Data Search** are form-based query applications for both Industry Data and Commodity Data designed for users unfamiliar with the PPI coding structure. These applications guide a user through the PPI classification by listing index titles and do not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user’s browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple-screen, non-Java-based application. Both methods allow a user to browse the PPI coding structure and select multiple series. Users can modify the date range and output options after executing the query using the reformat button above the data output table.
- **Series Report** is a form-based application that allows users to input multiple, formatted PPI time series identifiers (commodity or industry codes) as inputs in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for users who are familiar with the format of PPI time series identifiers. There are five alphabetic prefixes used to create unique PPI time series identifiers: WP, WD, PC, PD, and ND. Each provides the user access to a different PPI database. Adding either a “u” (not seasonally adjusted) or an “s” (seasonally adjusted) to the end of these prefixes further specifies the type of data needed.

EXAMPLES

For commodity and FD-ID indexes, series identifiers combine a “wpu” prefix (not seasonally adjusted) or a

“wps” prefix (seasonally adjusted) with a commodity code.

<u>Commodity code</u>	<u>Provides data for:</u>
wps141101	Passenger cars, seasonally adjusted
wpu141101	Passenger cars, not seasonally adjusted
wpufd4	Final demand, not seasonally adjusted
wpsid63	Services for intermediate demand, seasonally adjusted

For discontinued commodity indexes, series identifiers combine a “wdu” prefix (not seasonally adjusted) or a “wds” prefix (seasonally adjusted) with a commodity code.

<u>Commodity code</u>	<u>Provides data for:</u>
wds019	Other farm products, seasonally adjusted
wdu0635	Preparations, ethical (prescription), not seasonally adjusted
wdusi138011	Stainless steel mill products, not seasonally adjusted

Current price indexes grouped by industry according to NAICS have series identifiers that begin with the prefix “pcu.” After the prefix, there are 12 digits (the 6-digit industry code is listed twice) followed by up to 7 alphanumeric characters identifying product detail. Dashes are used as placeholders for higher-level industry group codes.

<u>Industry-product code, current NAICS series</u>	<u>Provides data for:</u>
pcu325---325---	Chemical manufacturing
pcu336110336110	Automobile and light duty motor vehicle manufacturing
pcu621111621111411	Offices of physicians, one- and two-physician practices and single-specialty group practices, general/family practice

Discontinued industry-product codes based on SIC combine a “pdu” prefix and “#” between the fourth and fifth characters of the product code. Series identifiers for the discontinued dataset use underscores as placeholders to complete a reference to an SIC industry group code of fewer than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of NAICS in 2004.)

<u>Industry-product code, discontinued SIC series</u>	<u>Provides data for:</u>
pdu28_#	Chemicals and allied products
pdu331_#	Blast furnaces, steel works, and rolling and finishing mills
pdu3711#111	Passenger cars

Price indexes for discontinued series grouped by industry according to NAICS have identifiers that begin with the prefix “ndu.” After the prefix, there are 12 numeric digits (the 6-digit industry code is listed twice), and up to 7 additional alphanumeric characters that identify product detail. Dashes are used as placeholders for higher-level group codes.
